## GRanges objects

- The `GRanges()` constructor

- `GRanges` accessors

- Vector operations on `GRanges` objects

- Range-based operations on `GRanges` objects

## GRangesList objects

- The `GRangesList()` constructor

- `GRangesList` accessors

- Vector operations on `GRangesList` objects

- List operations on `GRangesList` objects

- Range-based operations on `GRangesList` objects

## Other resources

# The GRanges class is a container for...

... storing a set of *genomic ranges* (a.k.a. *genomic regions* or *genomic intervals*).

- ▶ Each genomic range is described by a chromosome name, a *start*, an *end*, and a strand.
- ▶ *start* and *end* are both **1-based** positions relative to the 5' end of the plus strand of the chromosome, even when the range is on the minus strand.
- ▶ *start* and *end* are both considered to be included in the interval (except when the range is empty).
- ▶ The *width* of the range is the number of genomic positions included in it. So  $width = end - start + 1$ .
- ▶ *end* is always  $\geq start$ , except for empty ranges (a.k.a. zero-width ranges) where  $end = start - 1$ .

Note that the *start* is always the leftmost position and the *end* the rightmost, even when the range is on the minus strand.

Gotcha: A TSS is at the *end* of the range associated with a transcript located on the minus strand.

# The `GRanges()` constructor

```
> library(GenomicRangesGHA)
> gr1 <- GRanges(seqnames=Rle(c("ch1", "chMT"), c(2, 4)),
+               ranges=IRanges(16:21, 20),
+               strand=rep(c("+", "-", "*"), 2))
> gr1
```

GRanges object with 6 ranges and 0 metadata columns:

|     | seqnames | ranges    | strand |
|-----|----------|-----------|--------|
|     | <Rle>    | <IRanges> | <Rle>  |
| [1] | ch1      | 16-20     | +      |

## GRanges accessors: `mcols()`

Like with most *Bioconductor* vector-like objects, *metadata columns* can be added to a GRanges object:

```
> mcols(gr1) <- DataFrame(score=11:16, GC=seq(1, 0, length=6))
> gr1
```

GRanges object with 6 ranges and 2 metadata columns:

|   | seqnames | ranges    | strand | score     | GC        |
|---|----------|-----------|--------|-----------|-----------|
|   | <Rle>    | <IRanges> | <Rle>  | <integer> | <numeric> |
| A | ch1      | 16-20     | -      | 11        | 1.0       |
| B | ch1      | 17-20     | -      | 12        | 0.8       |
| C | chMT     | 18-20     | +      | 13        | 0.6       |
| D | chMT     | 19-20     | -      | 14        | 0.4       |

# Vector operations on GRanges objects

What we call *vector operations* are operations that work on any ordinary vector:

- ▶ `length()`, `names()`
- ▶ Single-bracket subsetting: `[`
- ▶ Combining: `c()`
- ▶ `split()`, `relist()`
- ▶ Comparing: `==`, `!=`, `match()`, `%in%`, `duplicated()`, `unique()`
- ▶ Ordering: `<=`, `>=`, `<`, `>`, `order()`, `sort()`, `rank()`

GRanges objects support all these *vector operations* ==> They're considered *vector-like* objects.

## Vector operations on GRanges objects: Single-bracket subsetting

```
> gr1[c("F", "A")]
```

GRanges object with 2 ranges and 2 metadata columns:

|   | seqnames | ranges    | strand | score     | GC        |
|---|----------|-----------|--------|-----------|-----------|
|   | <Rle>    | <IRanges> | <Rle>  | <integer> | <numeric> |
| F | chMT     | 21-20     | +      | 16        | 0         |

## Exercise 1

- a. Load the *GenomicRangesGHA* package.
- b. Open the man page for the `GRanges` class and run the examples in it.
- c. Extract from `GRanges` object `gr` the elements (i.e. ranges) with a score between 4 and 8.
- d. Split `gr` by strand.

# An overview of *range-based* operations

## Intra range transformations

`shift()`, `narrow()`, `resize()`, `flank()`

## Inter range transformations

`range()`, `reduce()`, `gaps()`, `disjoin()`

## Range-based set operations

`union()`, `intersect()`, `setdiff()`,  
`punion()`, `pintersect()`, `psetdiff()`,  
`pgap()`

## Coverage and slicing

`coverage()`, `slice()`

## Finding/counting overlapping ranges

`findOverlaps()`, `countOverlaps()`

## Finding the nearest range neighbor

`nearest()`, `precede()`, `follow()`

and more...

## Examples of some common *range-based* operations

## Exercise 2

Using `GRanges` object `gr` created at Exercise 1:

- a. Shift the ranges in `gr` by 1000 positions to the right.
- b. What method is called when doing `shift()` on a `GRanges` object? Find the man page for this method.

```

and store them in a GRanges object:

```
> reads <- as(reads, "GRanges")
> reads[1:4]

GRanges object with 4 ranges and 0 metadata columns:
      seqnames      ranges strand

## findOverlaps() (continued)

Load the gene ranges from a *TxDb* package:

```
> library(TxDb.Dmelanogaster.UCSC.dm3.ensGene)
> txdb <- TxDb.Dmelanogaster.UCSC.dm3.ensGene
> dm3_genes <- genes(txdb)
```

and find the overlaps between the reads and the genes:

```

## Exercise 3

- a. Recreate `GRanges` objects `reads` and `dm3_genes` from previous slides.
- b. What method is called when calling `findOverlaps()` on them? Open the man page for this method.
- c. Find the overlaps between the 2 objects but this time the strand should be ignored.

## Exercise 4

In this exercise we want to get the exon sequences for the dm3 genome.

- a. Extract the exon ranges from `txdb`.
- b. Load the *BSgenome.Dmelanogaster.UCSC.dm3* package.
- c. Use `getSeq()` to extract the exon sequences from the `BSgenome` object in *BSgenome.Dmelanogaster.UCSC.dm3*.

storing a list of *compatible* GRanges objects.

*compatible* means:

- ▶ they are relative to the same genome,
- ▶ AND they have the same metadata columns (accessible with the `mcols()` accessor).

# List operations on GRangesList objects

What we call *list operations* are operations that work on an ordinary list:

- ▶ Double-bracket subsetting: `[[`
- ▶ `elementNROWS()`, `unlist()`
- ▶ `lapply()`, `sapply()`, `endoapply()`
- ▶ `mendoapply()` (not covered in this presentation)

GRangesList objects support all these *list operations* ==> They're considered *list-like* objects.

## elementNROWS() and unlist()

`reduce(grl)` is equivalent to `endoapply(grl, reduce)`
